News release: IMMEDIATE

NEOVEST RELEASES 6.0

August 20th, 2010 – Neovest is pleased to announce its newest product release, Neovest 6.0. This new version adds multiple features including integrated Pre-Trade Analytics, Futures trading, Calendar Spreads, and a new Docking Framework that allows Tabbed Windows, Hidden Headers, and Locked Layout capabilities. The Neovest 6.0 Montage window now offers the ability to display various market-data fields in the depth and to replace orders in the attached ticket. In addition, 6.0 provides support for Click Trading (sending orders via a single mouse click), customized coloring for market data fields, and the ability to utilize Single Order Actions via the Trade Manager window.

Another enhancement in 6.0 include its integration into the Neovest Portfolio Server. This integration not only allows Neovest greater flexibility with future enhancements but is a critical step in minimizing overall message processing and increasing the client capacity for large portfolios.

Docking View

Neovest 6.0 provides users with more control of their workspace. Users can add windows to a container view or keep them free floating. Users can create tabs containing multiple views and can minimize and maximize all windows with a single click. The docking view also allows the user to hide the title bars as well as lock the view once they configure their layout.

Pre Trade Analysis

A keynote feature in Neovest 6.0 is Pre-Trade Alerts, which alerts you if an order exceeds a specified average daily volume percentage or a remaining daily volume percentage.

The trader can easily click on the alert and view Pre-Trade Analytics including Market Impact, Timing Risk, Time-to-Fill, and Percentage of Volume. The graphical view shows an estimated price range and time-to-fill based on the user's aggression level.

Liquidity Field

Neovest 6.0 includes the Liquidity field available in the Trade Manager and the Account+ windows. This unique field will display where the route received its liquidity for the order. This can be used with Neovest AlgoGenetics orders as well as broker algorithms..

Order Tracking

New in the Neovest 6.0 Order Tracking window is a summary section that allows traders to view their average price on the order they are tracking.

Account+

The Neovest 6.0 Account+ module enhancements include enhanced order tracking and price roll-ups and the ability to rename the tabs and filtering by issuer and exchange. Neovest has also added the ability to display "Time" fields in Military Time format, the ability to show "StartTime/EndTime" field values in Local Time, and a tool tip to appear when hovering on the "Parameters" field. Other fields added into the Account+ view are:

- Entry Price, Stop Price, and Execution Price in fractions
- TradeGMV, TradeNMV, Pending GMV, and Pending NMV in the Summary
- Description, VolAve%, P2Close, Last, and AcctShort
- Added "Time" fields that display in GMT

Allocation and Bunching

A number of enhancements have been made to the Neovest 6.0 Allocation and Bunching window. These include:

- Support for setting commission values on Futures symbols
- Enhanced workflow allowing users to bust a single leg of an allocation
- Added ability to create new Allocation Accounts while Allocate dialog is open
- Added alert reminder asking if you have allocated your trades when exiting the system

Montage Window

Neovest has provided the ability to comingle level one data (Last, High, Low, etc.) with the market depth in the Montage window. In addition, the Neovest 6.0 Montage window allows the user to scroll their Bids and Offers independently.

Click Trading

Neovest 6.0 allows users to open and instantly configure actions or tickets by clicking on the bid, ask, last, bid size, ask size, or last size.

Once the tickets open, they may be pinned to the workspace or automatically closed when the order is sent.

Order Ticket Workflow Enhancements

The trader can select their order in the Neovest 6.0 Order Montage window and the attached ticket will automatically convert to "Change Mode."

Futures

Neovest 6.0 supports Futures trading that includes Calendar Spreads. The QuoteWatch window enhances the users workflow, allowing them to roll contracts, click trade, and use the Symbol Lookup to find instruments.

Other Features
